

PSS MCX™ columns

Product information from PSS Polymer Standards Service GmbH

version: 01-01

The **chromatographic column** for
analysis of technical products and **food/beverages**.

Key benefits

- Aqueous Polyanion Analysis without Organic Modifiers
- Superior Resolution for Oligosaccharide Analysis
- Durability and High Pressure Stability
- Reliable for Fruit Acids and Alcohol Analysis

PSS MCX™ columns
are very stable
at high pressures
and any pH-value.

The PSS MCX™ - Applicability

GPC:

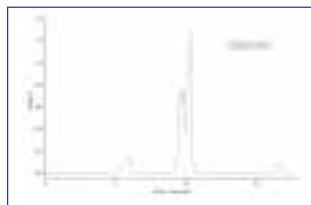

Neutral water soluble polymers: Sugars, Starches and their derivatives Dextran, Pullulan, Cellulose, modified Cellulose

Anionic water soluble polymers: Polyacrylic acid, Polymethacrylic acid, Polystyrenesulfonate, Carboxymethylcellulose, Polyaspargid acid, Hyaluronic acid, Heparin, Lignins, Lignin sulfonates, Humic Substances
(buffered water without organic modifier)

Please note: No GPC separation with Ammonium Compounds and Poly Cations

HPLC: Fruit acids, alcohol, pectin, sugars

Fig. 1

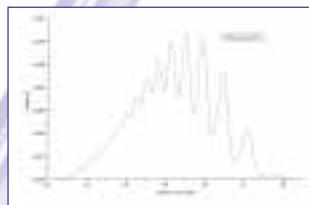

Analysis of apple juice, Separation of pectin, sugars and alcohol.

Elution volumes: Pectin: 6ml, different sugars: 10ml, ethanol: 17ml

Analytical conditions: column: PSS MCX™ 1.000Å, 5µm, 8x300mm, flowrate: 1.0ml/min, temperature: 20°C, eluent: 0.05% NaN₃ in H₂O, detector: RI

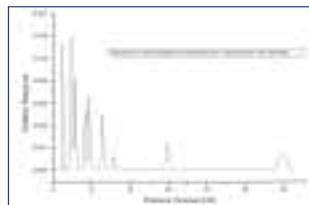

Fig. 2

Analysis of oligomeric sugars (hydrolyzed dextran)

Analytical conditons: columns: 3x PSS MCX™ 1.000Å, 5µm, 8x300mm, flow: 0.5ml/min, temperature: 80°C, eluent: 0.05% NaN₃ in H₂O, detector: RI

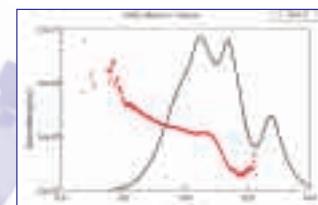

Fig. 3

Analysis of different fruit acids and alcohols

Analytical conditions: column: PSS MCX™ 100Å, 5µm, 8x300mm, flow: 0.5ml/min, temperature: 80°C, eluent: 0.05M H₂SO₄ in H₂O, detector: RI

Fig. 4

GPC-analysis of lignin sulfonate with RI and light scattering detection

Analytical conditions: columns: 1x PSS MCX™ 1.000Å, 10µm and 1x PSS MCX™ 10Å, 10µm; 8x300mm. flow: 1ml/min, temperature: 20°C, eluent: 0.07M Na₂HPO₄ in H₂O, detectors: RI (black) and light scattering (red)

PSS MCX™ - Specifications

Porosity [Å]	Particle Size [µm]	Theor. Plates* [N/m]	Pressure Stability [bar]	Typical Back- ** pressure/30 cm [bar]
100	5	> 25.000	200	40
500	5	> 25.000	200	40
1.000	5	> 25.000	200	40
1.000	10	> 20.000	200	25
10 ⁵	10	> 10.000	100	25
10 ⁶	10	> 10.000	80	25
10 ⁷	20	> 5.000	60	7

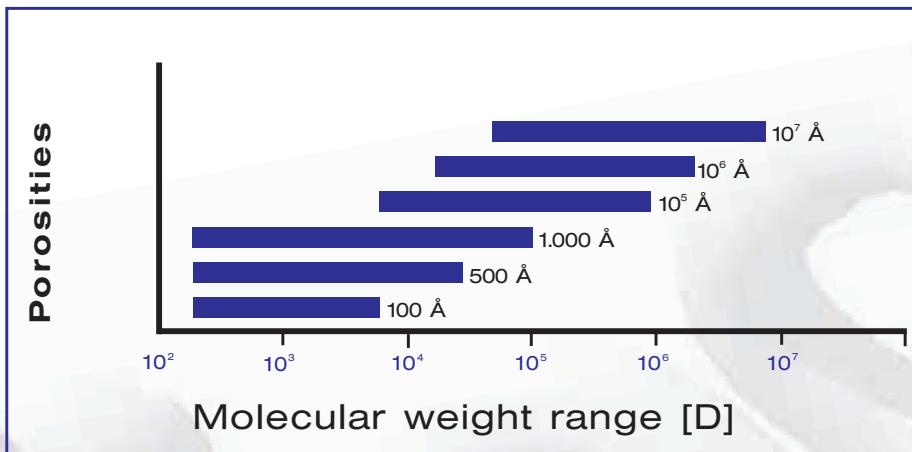

*) The plate count is determined with dextran P1 (glucose) (1.0ml/min, 20°C).

**) Analytical columns (8x300mm) at 20°C, flow: 1.0 ml/min, eluent: water + 0.05% NaN₃.

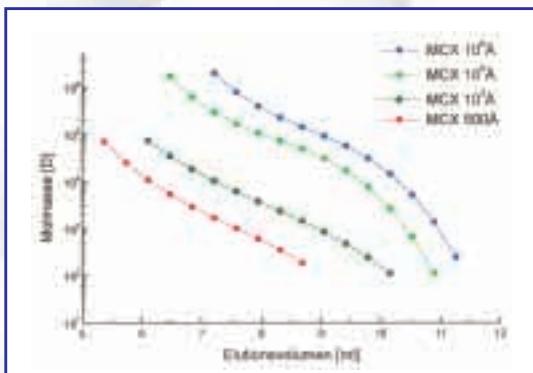

The asymmetry is in the range between 0.7 and 1.5. The recommended working temperature should be between 20°C and 90°C. The maximum flow should not exceed 2.5ml/min. Increasing the working temperature from 20 to 80°C and/or reducing the flow rate from 1.0 to 0.5ml/min increases theoretical plate counts of up to 60.000/m (for PSS MCX™ 5µm, 100, 500, 1000Å columns).

PSS MCX™-Separation Range

PSS MCX™-Calibration Curves

Calibration standards: Pullulan
PSS MCX™ 8x300mm,
flow: 1.0ml/min,
temperature: 20°C,
eluent: 0.05% NaN₃ in H₂O, detector: RI

The PSS MCX™ - Features

Versatility:

Compatible with aqueous buffers and/or aqueous/organic mixtures. PSS MCX™ does not require the addition of organic modifiers to aqueous GPC-systems (e.g. for analysis of lignin, humic substances, arylsulfonic acid). PSS MCX™-columns can be used for GPC or for HPLC with manipulation of analytical conditions. Separations in neutral or alkaline solutions are typically GPC separations, whereas low concentrations of strong acids are typically HPLC separations, i.e., separation of carboxylic acids in nutrition technology applications.

Chemical Stability:

PSS MCX™-columns are stable at any pH or buffer concentration. PSS MCX™ also performs well in the presence of large quantities of organic modifiers such as methanol or acetonitrile. Column properties are retained even after subject to the high pH environments (typical of the wood and paper industry).

Durability:

Longer lifetime than competitive products. Long lasting performance at working temperatures of 80°C and flow rates of 1.0ml/min. Enhanced resolutions are achieved at flows of 0.5ml/min.
